

# IoT Device FIRMWARE UPDATER

Device Firmware Updater (DFU) updates firmware on embedded systems remotely, over the air.

The IoT Device Firmware Updater works on most popular communication networks: **Cellular, Ethernet, Wi-Fi, LoRa, and more.**

You can add The IoT Device Firmware Updater to your device regardless of **CPU** or **MCU**.

## KEY FEATURES

- Recovers from corrupt firmware update by falling back to last good version.
- Multiple firmware versions can be supported on device.
- Works at a pace set by device to avoid draining battery, and network overages.
- Can selectively apply different versions of firmware to subsets of devices.

## KEY BENEFITS

- Seamlessly update firmware on devices after deploying.
- Obtain a snapshot of firmware version running on all deployed devices.
- Install unique firmware on different device groups.
- Beta test firmware on selected devices before wide deployment.

\*TYPICAL COMPRESSION RATIO BETWEEN CONSECUTIVE FIRMWARE RELEASES.
